Agree or disagree with the following statement?

Technology makes children less creative.

In the 21st century, humans have dramatically developed technology, and the possibility that technology provides them became infinite. As technology advanced, the concept of education also changed a lot compared to education in the past. Some might claim that children become less creative than in the past as a result of the progression of technology, yet I personally believe that technology actually contributes to be more creative.

First of all, as technology advances a lot, it is true that children gain more options about what they can do; thus, technology itself provides more chances to make children creative. In modern society, it is nothing unusual that children around middle school invented qualitative game software based on their skills of programming and became rich. Now, education is about to focus on early exposure to technology. On the contrary in the past when technology did develop a lot, children have never had such a chance. Thus, I believe that technology itself reshaped society to an environment that children are more likely to do creative things.

Second of all, I personally believe that technology contributes to providing countless information; therefore, children become more creative as they learn and know a lot. In today's society, technology enables us to provide a lot of useful information whenever we want. For children also, technology is a crucial factor as an information provider. Once they get enough information, they can try something they want to do, and technology helps them even if they are stuck on something. Therefore, technology fully supports children who want to challenge something, and as they try to repeat challenges, they can be creative.

On the other hand, some might claim that technological development unfortunately makes children less creative since it makes children rely on computers too much and loses the opportunity to think by themselves. However, I want to point out that the reason children depend on technology too much is not their faults. As long as technology is used in correct ways as the tools for expanding children's creativity, it plays an important role as supporting tools for children. In the modern era, children are able to adapt to the technological society well and come up with lots of interesting ideas using technology.

In conclusion, the possibility that technology provides children is limitless, and it is crucial for children to be creative.
